

Adding excel exporting to XPages using POI4XPages

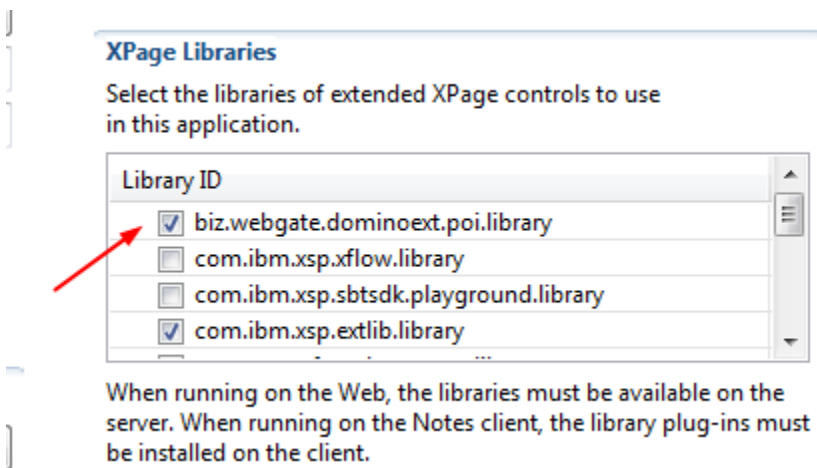

You can reference the original article submitted by [Fredrik Norling](#)

Quick Summary

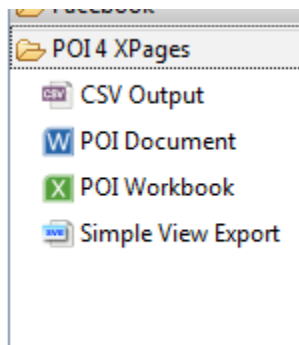

This article will show you how to create and run a simple view to excel export using [POI4XPages](#), which is an OSGI Plugin that adds [Apache POI](#) support to your XPage Project.

How-to-guide

1. First you need to install [POI4XPages](#) plugin from OpenNTF to your server and client
 1. **Note:** An article for installing the POI4XPages OSGI Plugin will be coming soon
2. Open up the database in Domino Designer that will be using POI
3. Open "Xsp Properties" and click on the Page Generation tab

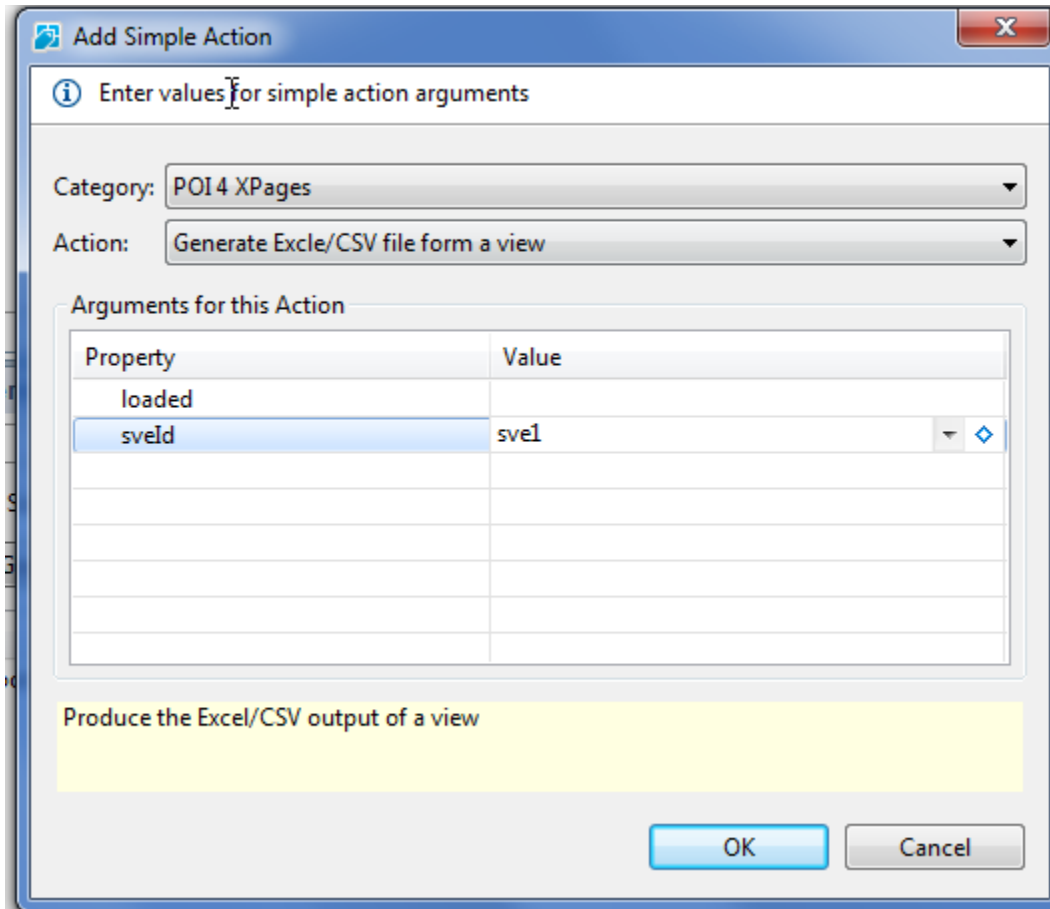

4. Create a new XPage. You'll see the following controls in the Controls Palette

5. Drag the simple View Export into you new Export XPage also create a button on your XPage

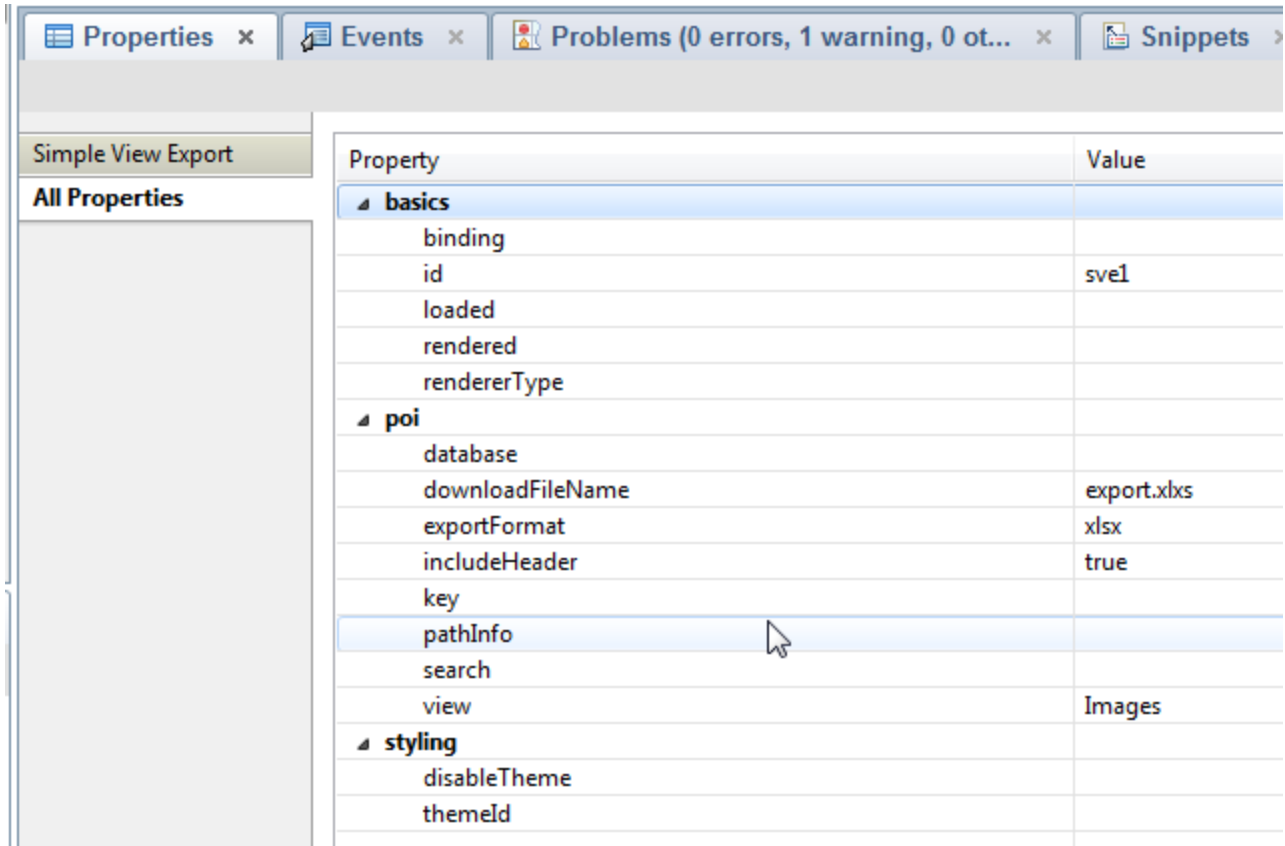

6. Click on the button and create a simple action

7. Select the sveId, you should find the ID of your simple Export control in the list.

8. Select you export component and select "All properties"

9. Add a **downloadFileName** with a name of your choice i.e **export.xls**
10. set include header to true if you want to export the view headers
11. Set the view you want to export in the property view

Now you are ready to run the export. Try it by previewing the XPage
