

# accessPermission

`accessPermission` is router parameter, which limits the usage of the route to users who are member of listed group(s) or have listed role(s)

## Example

```
router.POST('customers/{id}') {
  strategy(DOCUMENT_FROM_VIEW_BY_KEY) {
    keyVariableName("{id}")
    viewName("customerById")
  }
  accessPermission "[CustomerService]"
  mapJson "company", json:'company',type:'STRING'
  mapJson "fdFirstName", json:'firstname', type:'STRING'
  events VALIDATE: {
    context ->
    //Accessing the payload
    json = context.getJsonPayload()
    //Accessing the JsonObject
    id = json.getJsonProperty('id')
    if (id == '') {
      context.throwException("ID should not be null or empty")
    }
  }
}
```

In this case, POSTing to URL `http://server.name/path-to/db.nsf/xsp/.xrest/customers/123` will be allowed only for users with role `[CustomerService]`
