

addSpaceMembers (since 0.8.0)

Members can be added to a Space through the "addSpaceMembers" mutation on a *WWClient* or *WWGraphQLEndpoint*. The method takes a List of **SpaceMemberObject** objects. The SpaceMemberObject takes an id for the person and permissions. The permissions are not yet in use, so just pass a blank string. The methods return an ArrayList of members IDs added.

addSpaceMembers

```
@Test(enabled = true)
@Parameters({ "appId", "appSecret", "space2Id", "profileId" })
public void addMembersToSpace(String appId, String appSecret, String space2Id, String profileId) throws
WWException, UnsupportedEncodingException {
    WWClient client = WWClient.buildClientApplicationAccess(appId, appSecret, new WWAAuthenticationEndpoint());
    client.authenticate();
    List<SpaceMemberObject> members = new ArrayList<SpaceMemberObject>();
    SpaceMemberObject obj = new SpaceMemberObject("1281ac4d-74f1-4aaa-bbb7-29123410aaa3", "");
    List<String> ids = client.addSpaceMembers(space2Id, members);
    assert ids.size() == 1;
}
```
